

RaceDay - Part 1 Video Presentation Guide

Student: ST10488271 | Module: PROG6212 | Part 1 - Planning & Database

This guide contains a full narration script you can read while screen-sharing, plus a step-by-step recording checklist. The brief requires your **own voiceover** explaining your design decisions - AI-generated voices are not permitted - so use this script as a starting point and speak it in your own words.

Narration Script

Intro

~20 sec

Hi, I'm [your name], student number ST10488271, and this is my Part 1 submission for PROG6212 - the RaceDay event management system. In this video I'll walk through my ERD, my API endpoint plan, and run my SQL script live in SSMS.

ERD Walkthrough

~90 sec - share docs/RaceDay_ERD.png

My ERD has six entities. Users stores both organisers and participants, differentiated by a Role field, since they share the same login and profile structure. An organiser creates many Events - that's a one-to-many relationship. Each Event has many Categories, like a 5km or 10km option. A Participant enrolls in a Category through the Enrolments table, which is why Enrolments has two foreign keys - one to Users, one to Categories. Each Enrolment can produce one Result once the race is finished, captured by an organiser - that's the dashed line to Users. Finally, each Event has RouteInfo for race-day prep, like distance and elevation.

Endpoint Plan Walkthrough

~60 sec - share docs/API_Endpoint_Plan.md

My endpoint plan covers six areas: authentication, user profile, events, categories, enrolments, and results. For example, POST /api/enrolments lets a participant enter a category, and it's restricted to the Participant role, while POST /api/results is restricted to Organiser, since only organisers capture race results. I planned status codes for both success and failure cases, like 409 Conflict if someone tries to enrol twice.

SQL Script - Live Run in SSMS

~90 sec

Now I'll run my SQL script live. (Open SSMS, open the .sql file, hit Execute.) This drops and recreates RaceDayDB, creates all six tables with primary keys, foreign keys, and constraints - for example, Role on Users has a CHECK constraint so it can only be Organiser or Participant. Then it seeds sample data: two organisers, three participants, three events, categories, route info, and some enrolments and results. (Expand Databases > RaceDayDB > Tables, run a SELECT * FROM Users; to prove it worked.)

Close

~15 sec

That's my Part 1 submission - the ERD, endpoint plan, and database script are all in the /docs folder, and my CI/CD workflow validates that structure on every push. Thanks for watching.

Recording Checklist

1. Install a free screen recorder

Download OBS Studio (obsproject.com) or use Windows' built-in Xbox Game Bar (Win+G) / Mac's QuickTime screen recording. OBS gives more control over audio levels.

2. Set up your scene

In OBS, add a 'Display Capture' or 'Window Capture' source so it records your screen, and add an 'Audio Input Capture' source for your microphone. Do a 10-second test recording first to check your mic isn't too quiet or clipping.

3. Open your materials in advance

Have RaceDay_ERD.png, API_Endpoint_Plan.md, and RaceDay_Database.sql already open in separate windows/tabs so you can Alt+Tab between them smoothly instead of hunting for files on camera.

4. Record in one take (or a few short takes)

Follow the script above. It's fine to pause and restart a section if you stumble - you can trim in editing, or just do a full retake since the video will likely only be 4-5 minutes total.

5. Run the SQL script live, don't just show it

The brief specifically wants you to run the script in SSMS during the recording, not just scroll through the code. Actually click Execute and show the tables appearing under Object Explorer.

6. Trim if needed

If you used OBS, the raw file needs no editing. If you want to cut mistakes, DaVinci Resolve or Windows' free Clipchamp can trim clips without re-encoding issues.

7. Upload as Unlisted to YouTube

Upload the file, and when publishing choose visibility 'Unlisted' (not Private, not Public). Copy the share link and paste it into README.md where the placeholder currently says '[Insert your unlisted YouTube link here]'.

Reminder: No AI-generated voices are permitted in the video. Use this script as a guide and speak it in your own voice and words so it reflects your own understanding of the design.
